

Hummingbirds of Georgia

Ruby-throated Hummingbird

Status in Georgia

Rare in state past October 31. Most wintering birds are found along the coast.

Size: 3 ¾"

Identification

Adult male has a bright red throat (gorget) that appears black in poor light, an iridescent green back, white underparts and grayish-green sides. Adult female has a metallic green back, white throat and grayish-brown sides.

Breeding Range

Only hummingbird known to breed east of the Mississippi River. Breeds throughout the eastern United States as far west as eastern Texas and Oklahoma north to Minnesota.

Winter Range

South Florida, southern Mexico to Panama

Black-chinned Hummingbird

Status in Georgia

Fewer than five reported in state each winter.

Size: 3 ¾" (slightly larger than the ruby-throated hummingbird)

Identification

Adult male appears much like a ruby-throated male. Throat is black with a violet band along the lower edge of the gorget seen only in good light. Adult female appears much like a ruby-throated female.

Breeding Range

Breeds from southwestern British Columbia southward into western Mexico and as far east as Texas.

Winter Range

Mexico

Anna's Hummingbird

Status in Georgia

Only three records for Georgia.

Size: 4"

Identification

Adult male's head is a deep rose-red. Color will actually extend down the side of the neck. Underparts are grayish-green. Adult female often displays tiny red feathers that form a small reddish patch on the throat. Underparts are grayish-green.

Breeding Range

Washington, Oregon, California, Arizona

Winter Range

Pacific coast area from Washington to northwest Mexico and Arizona.

Broad-tailed Hummingbird

Status in Georgia

A very rare winter visitor.

Size: 4"

Identification

Adult male looks much like a ruby-throated male, having a green back, rose-red throat, white underparts and green sides. Adult female has a green back, streaked throat, white underparts and pale brown sides.

Breeding Range

East-central California and Nevada, north to Montana and Wyoming to very western Texas and Mexico.

Winter Range

Central Mexico southward

Magnificent Hummingbird

Status in Georgia

Two birds documented in Georgia, one in summer.

Size: 5 ¼" (Georgia's largest hummingbird)

Identification

Adult male is metallic bronze-green, with cinnamon rufous color in tail and purple crown. Adult female is duller with no purplish crown.

Breeding Range

Mountainous regions of southern Arizona and southwestern New Mexico to Central America

Winter Range

Mexico southward

Broad-billed Hummingbird

Status in Georgia

One bird has been documented in Georgia. An adult male overwintered in a backyard in Macon during the winter of 2001-2002.

Size: 4"

Identification

Adult male displays brilliant emerald green feathers on his breast, sides, belly and back. His gorget is sapphire blue. The bill is reddish-orange and black near the tip. The male's tail is deeply forked, dark blue with a grayish border. Adult female lacks the sapphire gorget and is green to bronze-green on its underside with a pale throat. The female's bill is predominantly blackish with some orange near its base.

Breeding Range

The Broad-billed Hummingbird is a Mexican bird that ventures into the United States regularly only in southern Arizona and southwestern New Mexico. It is the most common hummingbird in the lowlands of northwestern Mexico.

Winter Range

Mexico (several birds have been seen in South Carolina, Louisiana, Mississippi and Alabama)

Allen's Hummingbird

Status in Georgia

Less than a dozen records in Georgia.

Size: 3 ¾" (slightly larger than a Ruby-throated Hummingbird)

Identification

Adult male has a green back, orange-red gorget, reddish-brown sides, rump and tail. Adult female cannot be safely separated from the female Rufous Hummingbird in the field. Female has reddish-brown color in the tail, greenish back, streaked throat and reddish-brown flanks.

Breeding Range

Coastal California

Winter Range

Mexico

More about hummingbirds . . .

The vast majority of hummingbird species that occur in Georgia are only seen in winter. Many are immatures or females and many cannot be identified unless captured and closely examined. Little is known about their movements and the habitats they use in Georgia and elsewhere in the southeast. With this in mind, reporting sightings of wintering hummingbirds can be extremely valuable. Chances are good that new species will be discovered in Georgia.

Rufous Hummingbird

Status in Georgia

Most common wintering hummingbird.

Size: 3 ¾" (slightly larger than Ruby-throated Hummingbird)

Identification

Adult male has a reddish-brown back, rump, tail and sides with orange-red gorget. Adult female has a green back, light brown sides and reddish flecks in throat that form a central reddish spot. Tail has varying amounts of brownish color.

Breeding Range

Southern Alaska through Washington, Oregon, western Montana and northern Idaho.

Winter Range

Throughout much of Mexico

Calliope Hummingbird

Status in Georgia

At least one or two birds are reported each winter.

Size: 3 ¼" (smallest bird in northern North America)

Identification

The male Calliope is Georgia's only hummingbird with rosy purple gorget feathers that form streaks against a white background. Adult female has a metallic bronze-green back; its sides and flanks are cinnamon; the throat is dull, brownish-white with dusky streaks and the breast is cinnamon-buff.

Breeding Range

Mountains of central British Columbia and southwestern Alberta to northern Baha California.

Winter Range

Mexico

Green Violet-ear Hummingbird

Status in Georgia

The only verified sighting was in Thomasville, July 2001.

Size: 4 ¾"

Identification

Both male and female birds are dark in color, have a moderately down-curved bill, and are grass green above and below the body. Males have a violet-green central breast spot and ear patch.

Breeding Range

No breeding records in the United States. Breeds in Mexico south into Peru and Bolivia.

Winter Range

Similar to the breeding range.
